

Clean lists. Clear decisions.

Check beneficiary lists for possible duplicates, household links and data gaps before distribution. Built for Arabic names. Your team makes every decision.

For humanitarian and development organisations

Pilot phase

Every list has the same hidden problems

One household, registered twice

Across rounds, enumerators or partners, the same household appears more than once, linked by name, ID, phone or spouse.

One name, written five ways

Arabic names change with spelling, order and length. Simple matching in Excel misses them.

One field visit, in the wrong place

Without clear data, verification teams spend time and budget where it is not needed.

When the list is checked fairly at the start, assistance reaches the households it is meant for.

Three steps, in minutes

Excel or CSV

Arabic or English

Results in minutes

Step 1

Upload your list

Excel or CSV, in Arabic or English, in the format you already use.

Step 2

Check the columns

No fixed template. VeriList reads your columns smartly. You only check what it is unsure about, then confirm the structure.

Step 3

Review the results

Download one file with a summary, registration quality by community, and every record with its evidence.

Round 1

Round 2

Then correct your list and upload it again to see what changed.

Everything your team needs to decide

EXAMPLE RESULT

Synthetic records

Record 1

●

Confirmed Duplicate

Same ID number as record 2

Record 7

●

Likely Duplicate

Same name written two ways, same village

Record 11

●

Possible Household Relation

Spouse of record 12

Your decision:

Keep

Remove

Escalate

A summary of the whole list

How many records need review, by status, at a glance.

Registration quality by community

Where data is weak, and the main reason, from governorate down to village or neighbourhood.

Every record with its evidence

Status, matched records and the reasons for each flag, in plain words.

A Reviewer Guide

Clear steps to turn results into decisions and field action.

What it means for your project

VeriList strengthens the quality of beneficiary registration and gives project teams evidence for their decisions.

Fairer assistance

When your team resolves duplicates at the start, more assistance remains for other households in need.

One check per project

A single check at registration supports every later stage of the project.

Lower verification and monitoring cost

Field verification and monitoring budgets go to the records that need them, not to the whole list.

Evidence at every stage

Judge the quality of a beneficiary list at any stage of the project, from targeting to evaluation.

Built for how registration really works

Arabic-aware matching

Understands spelling variants, name order and partial names.

Every location level

From governorate down to village or neighbourhood, in rural and urban areas.

Clear evidence for every flag

Each flag shows what matched and why, so decisions can be explained.

A human decision on every record

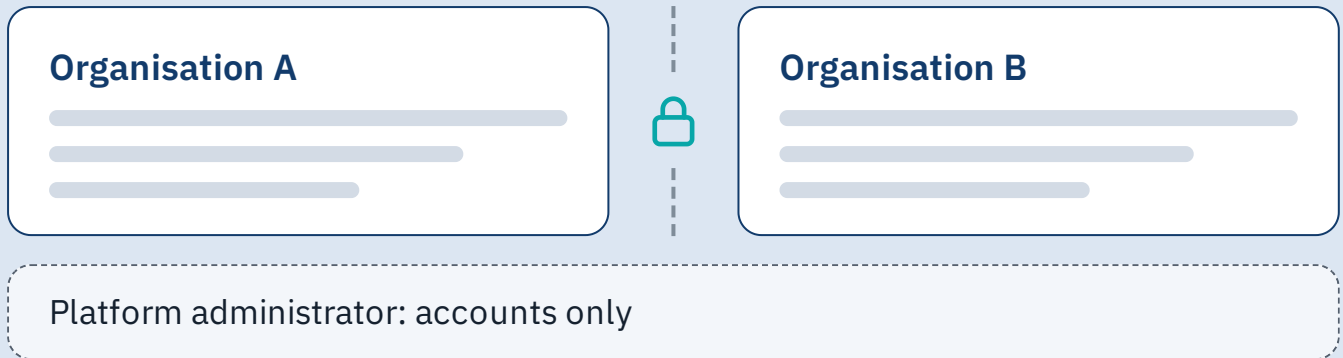

VeriList flags. Your team decides. Nothing is removed automatically.

Field verification where it matters

Focus inspection and third-party monitoring on the records and communities the data flags.

Your data stays yours

- ✓ Each organisation sees only its own lists.
- ✓ Platform administrators manage accounts. They do not see your records.
- ✓ You can delete a list and its results at any time.
- ✓ Only counts are kept for platform statistics. Never list content.
- ✓ No AI analyses your lists. VeriList's own rule-based checks read the file, match records and explain every flag.
